# Life Cycle of Dust

## ★ Telescope Basics

- Fundamental parameters
- Antenna types
- Detectors
- Aperture Synthesis Basics

# Where to build and observatory

- Ground-based observatories
- Atmospheric observatories: aircrafts and balloons
- Space-based observatories

# Ground-based observatories

- ⦿ Lowest cost
- ⦿ Familiar environment, but gravity → limitations on size
- ⦿ Access for construction, correction, repairs, and technology upgrading
- ⦿ Good locations also for small projects
- ⦿ Short term observations
- ⦿ **Atmospheric constraints**
  - Limited spectral window and noise on radio
  - Weather & Light pollution
  - Air stability → limited resolution
- ⦿ Seismic instability

# Observatory sites

- ◎ Best astronomical sites on Earth

Mauna Kea (Hawaii)

Chilean Andes (Paranal)

Dome C (Antarctica)

# Atmospheric observatories

- ⦿ Lack of atmospheric turbulence and absorption
- ⦿ Minimal atmospheric opacity and radiance
- ⦿ Lower cost than satellites
- ⦿ Advantageous in the infrared
- ⦿ Some degradation due to vibration

# Atmospheric observatories

- ◉ Airplane based:

- ◉ Balloon based:

# Space-based observatories

- ◉ Image quality just conditioned by optics → diffraction limited resolution
- ◉ Long term observations
- ◉ Access to every wavelength range
- ◉ Excellent instrumental stability
- ◉ Low levels of mechanical and thermal disturbances and weak gravity → engineering advantages
- ◉ Cost 10 to 100 times higher than Earth-based
- ◉ Relatively short lifetimes and no instrument upgrading
- ◉

# Popular observatory orbits

- ⊙ Earth orbits:
  - Low Earth orbit (LEO)
  - Geostationary and Geosynchronous orbit (GEO)
  - High Earth Orbits (HEO)

$$P = \frac{2 \cdot \pi}{\sqrt{GM_{\oplus}}} \cdot a^{\frac{3}{2}}$$

# Popular observatory orbits

- ◉ Lagrange points at 1.5 million km
  - Sun-Earth Lagrangian point L1: SOHO
  - Sun-Earth Lagrangian point L2: Herschel, Planck, Gaia, JWST, PLATO, ARIEL, etc

# Optical Astronomy: Optics in Astronomy

- **Telescope:** Optical instrument to observe very distant objects
- **Types:** refractor & reflector (& catadioptrics)
- **Rays trace**
- **Basic concepts**

Aperture:  $D$

Focal length:  $f$

Focal ratio: f-number =  $n = f/D$

Fast telescope (small  $n$ ), Slow telescope

Field of view & vignetting

# Telescope structure and mechanisms

- ⦿ Mounts for ground-based telescopes
  - The purpose of a “telescope mount” is to support the telescope tube and allow for its rotation during pointing and tracking.

# Life Cycle of Dust

- Fundamental parameters

★ **Wavelength coverage:**  $\lambda_{\min} - \lambda_{\max}$

★ **D: Aperture** (diameter of the main dish / mirror / lens)

★  **$\theta$ : Angular resolution** (in radians):

$$\theta = 1.22 \frac{\lambda}{D}$$

★ **PSF: Point Spread function**

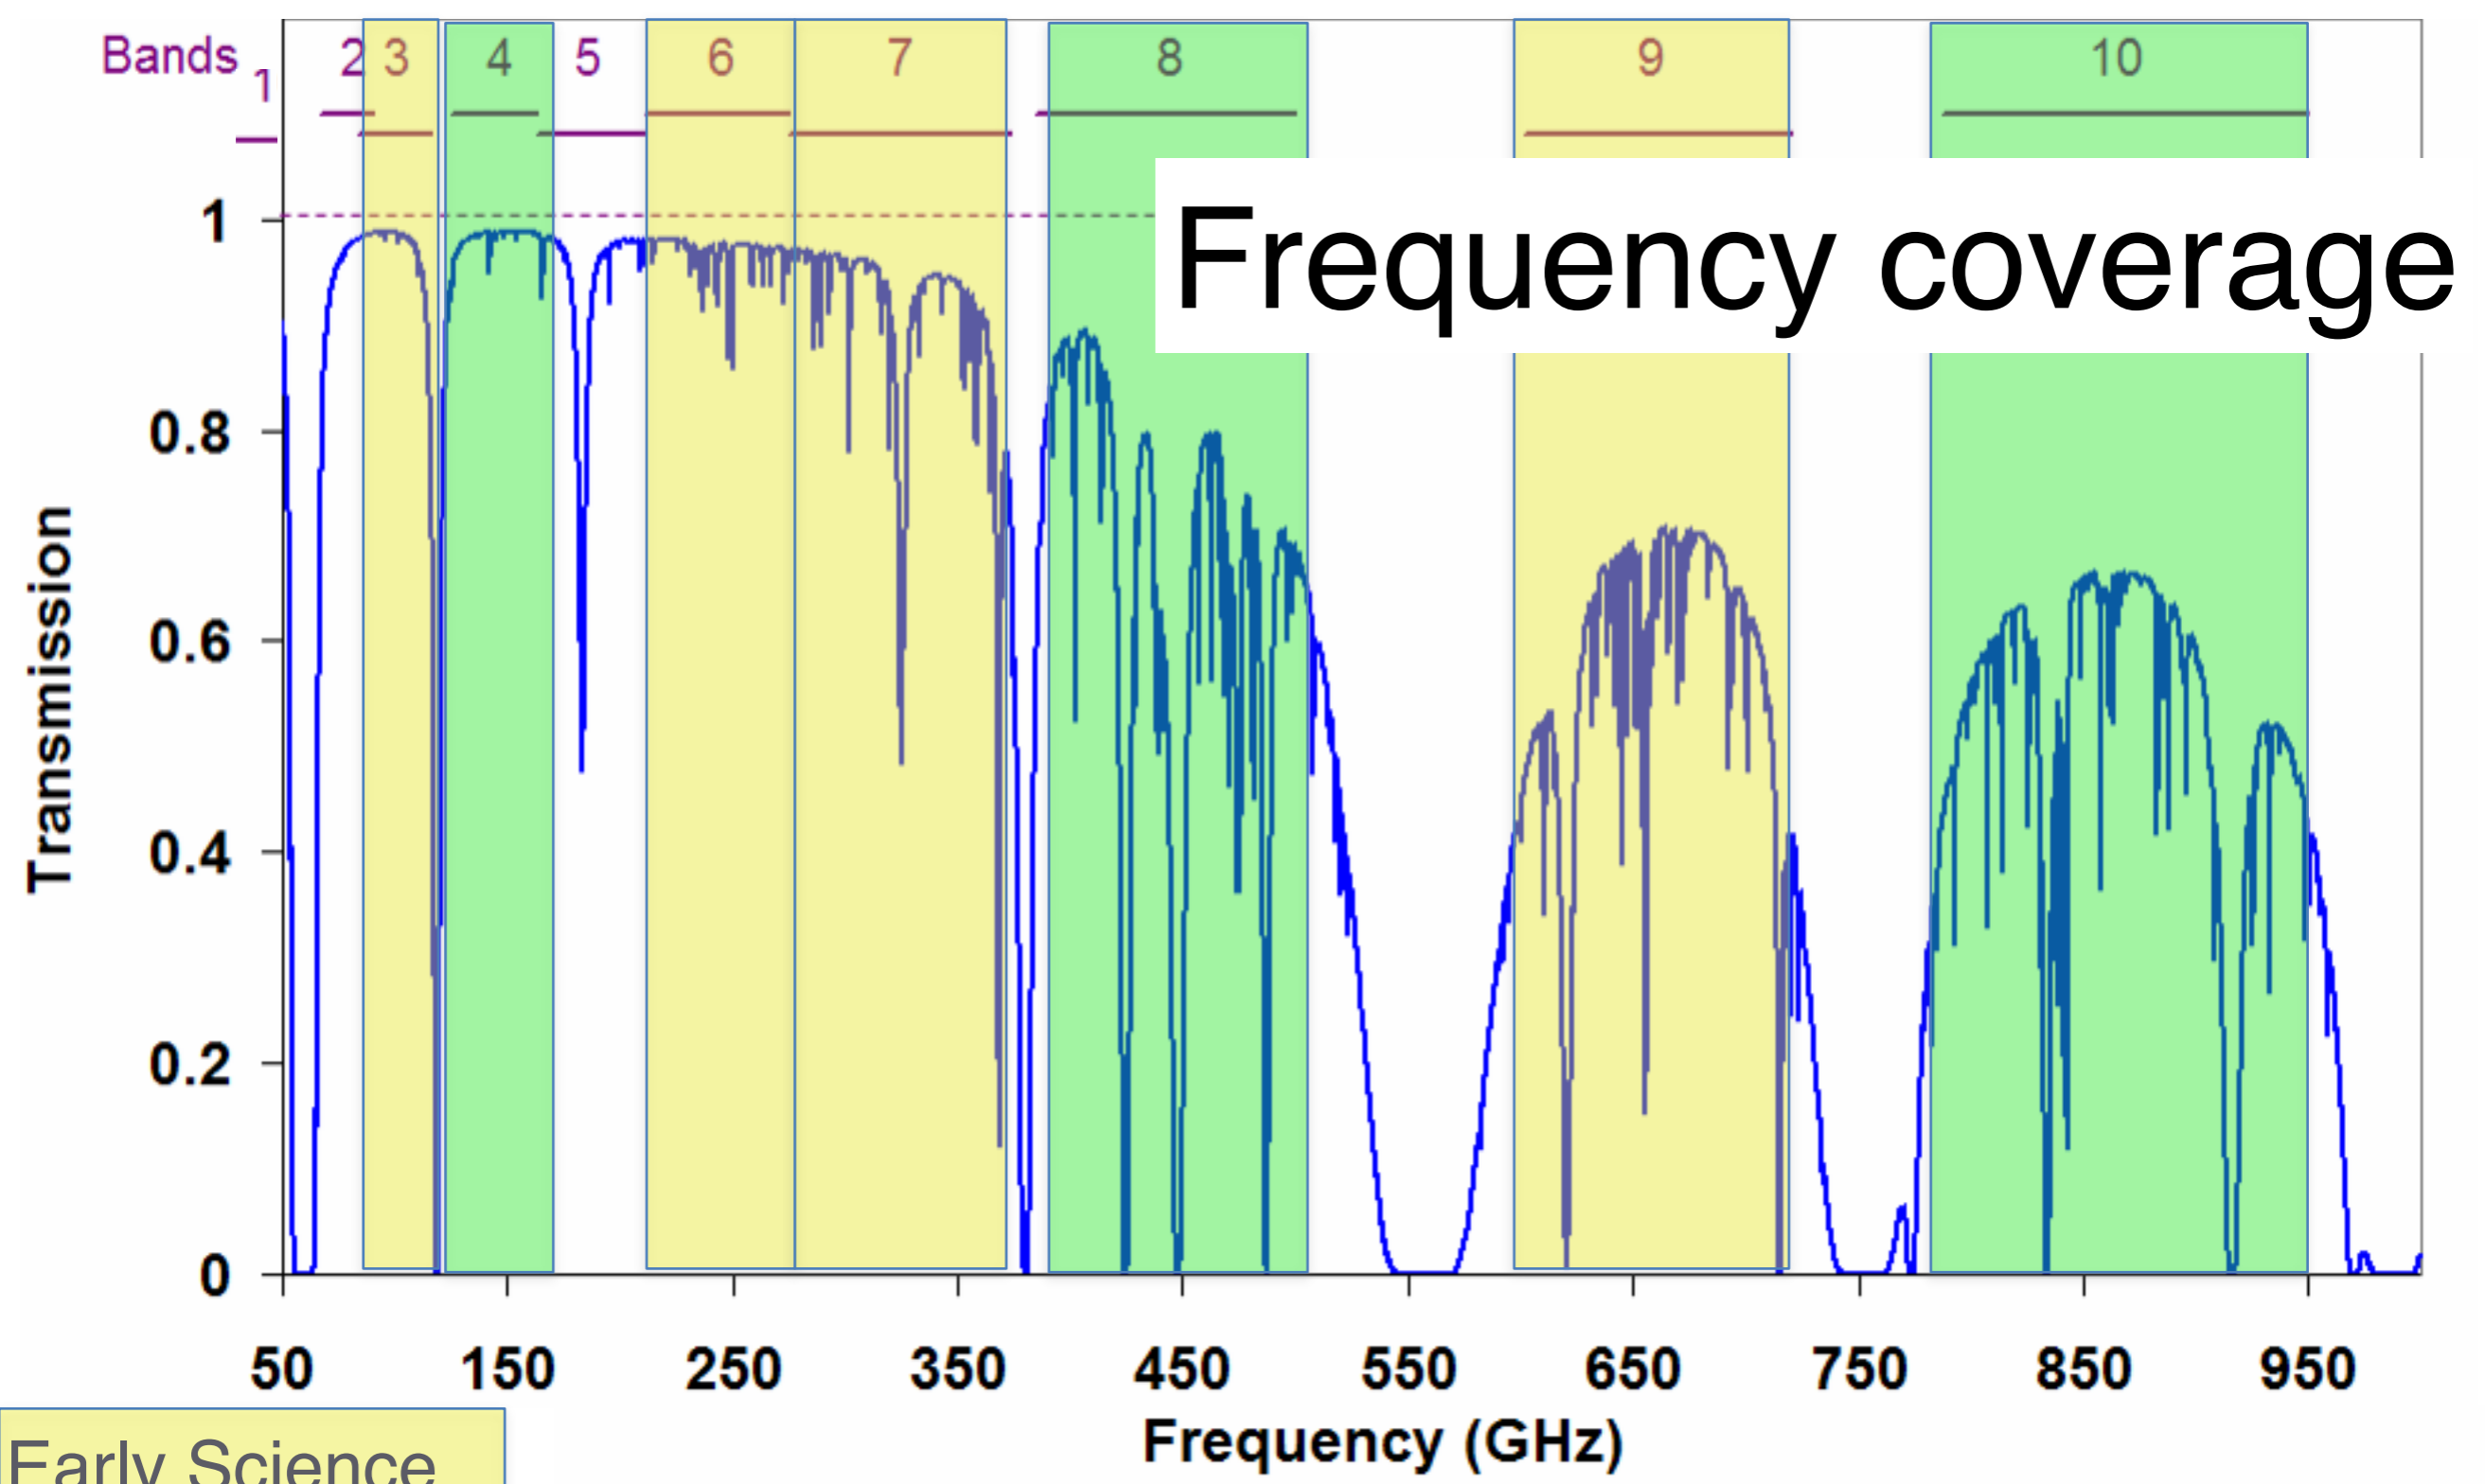

★ **FoV: Field of view**

★ **R: Resolving power (spectral resolution)**  $R = \lambda / \Delta\lambda$

$$\Delta v = \frac{300,000}{R} \text{ km/s}$$

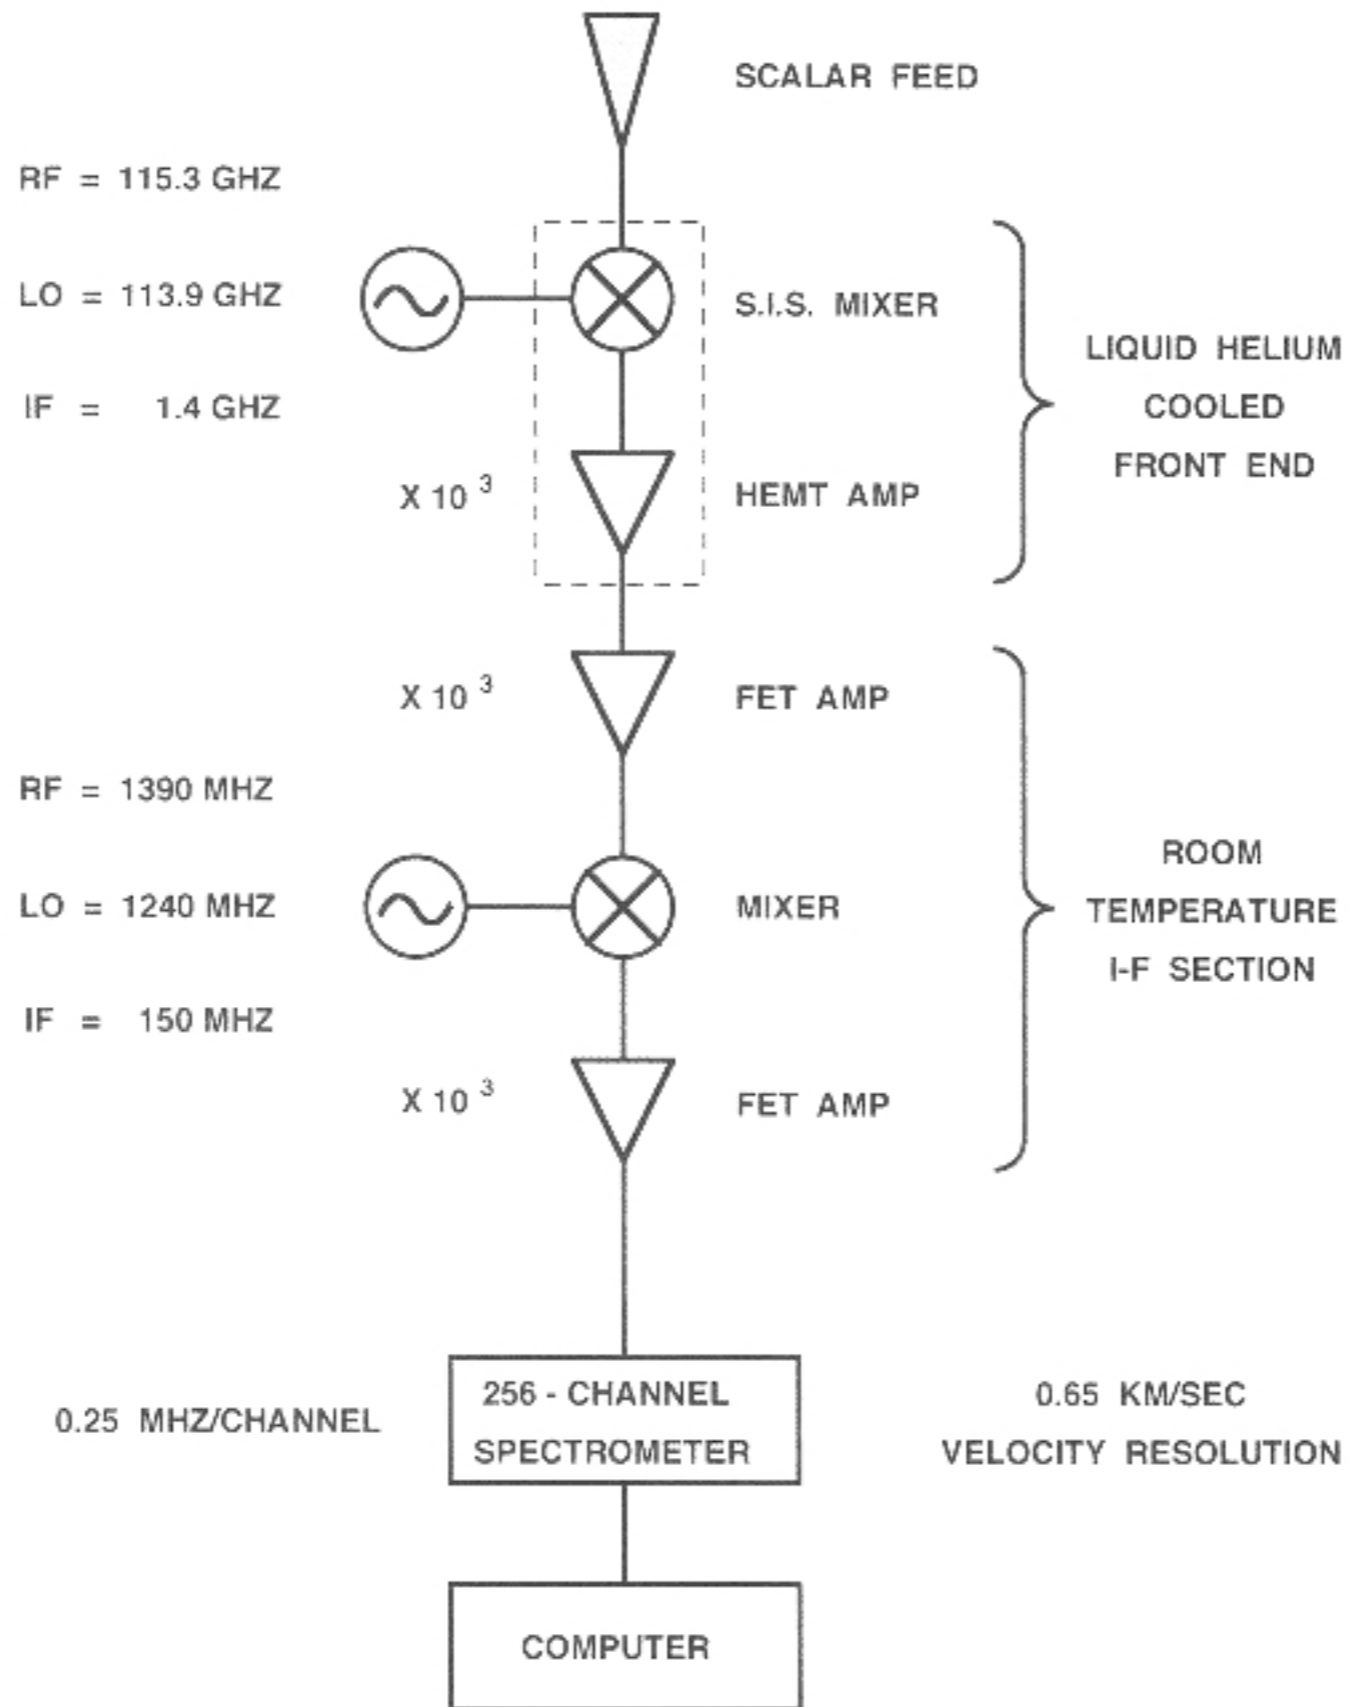

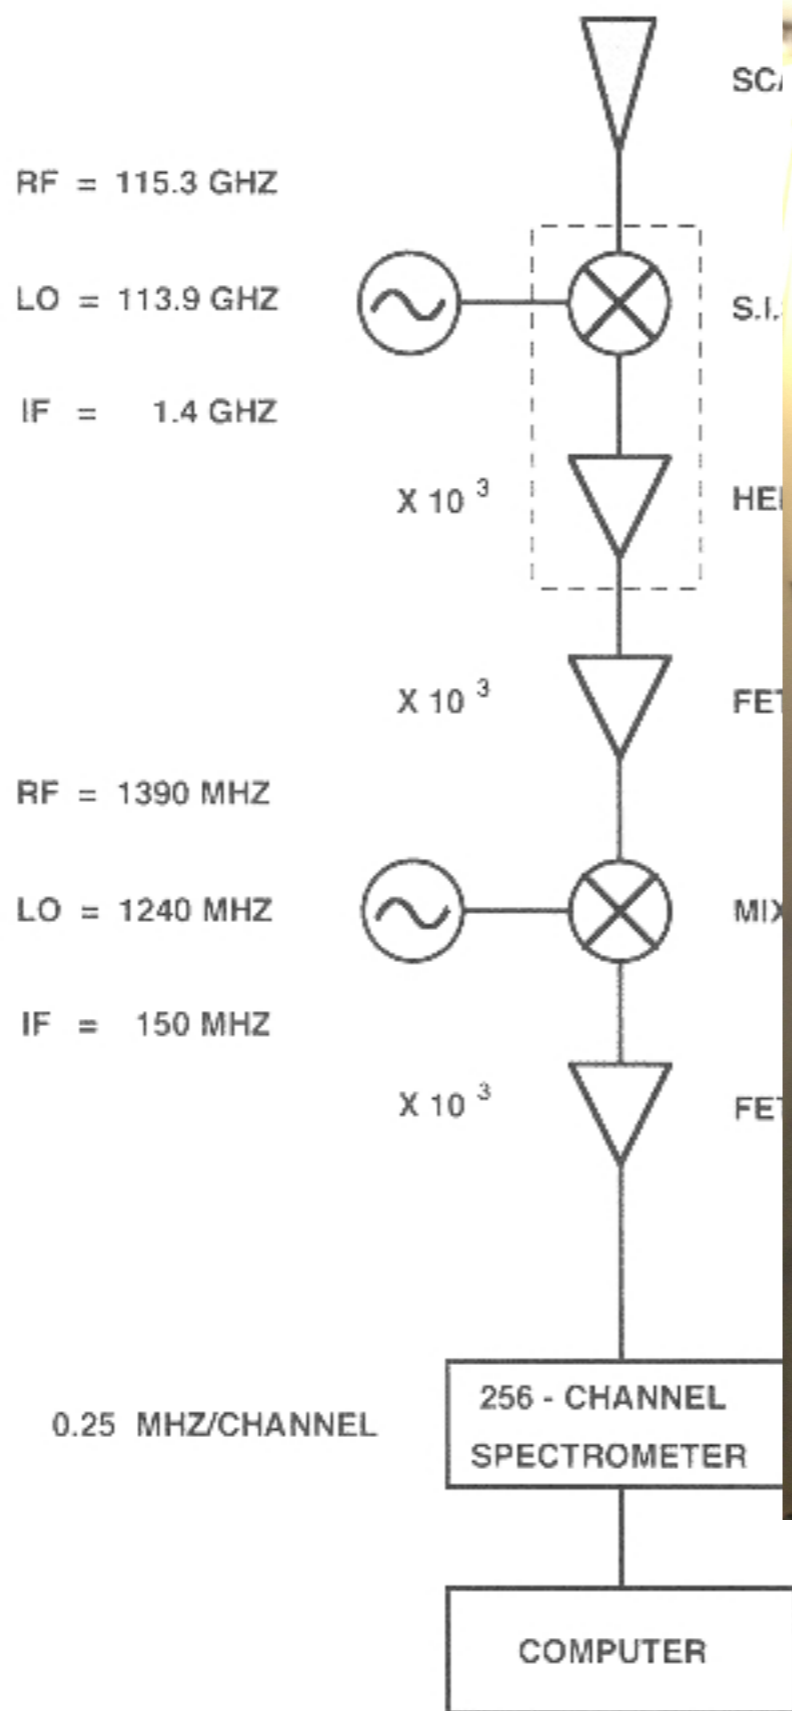

Figure 1

# Detectors: radio

# Detectors

# Detectors for a radio single-dish antenna: bolometers

- Bolometers as very sensitive thermometers
- Composite of an absorber and the actual thermometer (thermistor)
- The thermistor transforms the temperature variations of the absorber in electric signals

# Life Cycle of Dust

## ★ Telescope Basics

- Aperture Synthesis Basics

# The Stationary, Quasi-Monochromatic Interferometer

- Consider radiation from a small solid angle  $d\Omega$ , from direction  $\mathbf{s}$ , at frequency  $\nu$ , within  $d\nu$  :

$$l_{\text{delay}} = b \sin(\theta)$$

$$\tau_g = b \sin(\theta) / c$$

Geometric Time Delay

Cable length from A1 and A2 to correlator are different, a time delay correction must be used

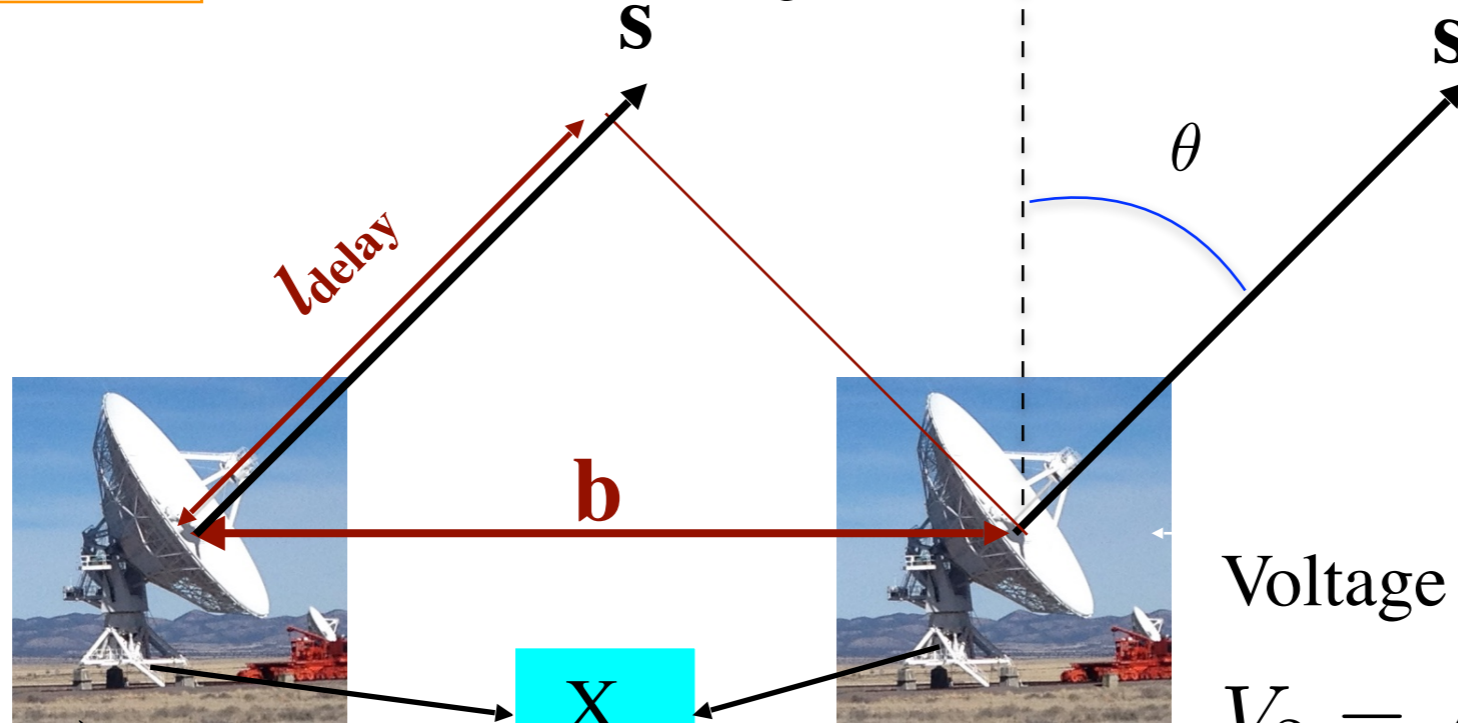

# The Stationary, Quasi-Monochromatic Interferometer

- Consider radiation from a small solid angle  $d\Omega$ , from direction  $\mathbf{s}$ , at frequency  $\nu$ , within  $d\nu$ :

Geometric Time Delay

$$l_{\text{delay}} = b \sin(\theta)$$

$$\tau_g = b \sin(\theta) / c$$

Voltage induced by the signal

$$V_2 = A_2 e^{i\omega t}$$

$$V_1 = A_1 e^{i\omega(t - \tau_g)}$$

multiplier

$$V_1 \cdot V_2^* = A_1 \cdot A_2 e^{-i\omega\tau_g}$$

average

$$R_{1,2} = A_1 A_2 \int_{t-T/2}^{t+T/2} e^{-i\omega\tau_g} dt = A_1 A_2 \frac{e^{-i\omega\tau_g}}{\omega\tau_g}$$

The path lengths from the antenna to the correlator are assumed equal.

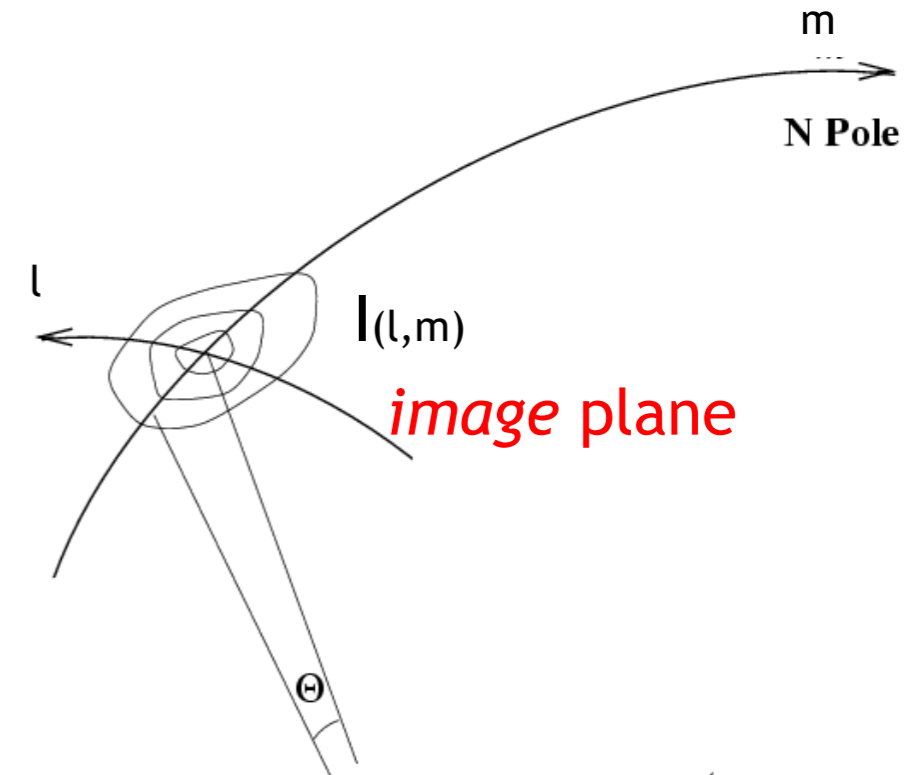

$$R_{1,2} = R_c + i R_s$$

- For small fields of view: the **complex visibility**,  $V(u,v)$ , is the **2D Fourier transform** of the brightness on the sky,  $I(l,m)$

$$V(u, v) = \int \int I(l, m) e^{-2\pi i(ul+vm)} dl dm$$

- We can now rely on a century of effort by mathematicians on how to invert this equation, and how much information we need to obtain an image of sufficient quality. Formally, **with enough measures of  $V$ , we can derive an estimate of  $I$ .**

$$I(l, m) = \int \int V(u, v) e^{2\pi i(ul+vm)} du dv$$

# 2D Fourier Transforms

# Visibility: Amplitude and Phase

ALMA

$T(x,y)$

$\text{Amp}\{V(u,v)\}$

$\text{Pha}\{V(u,v)\}$

# Aperture Synthesis

- **Example: 5 moveable antennas of the VLA- Let's assume are in a East-West configuration.**

# Aperture Synthesis

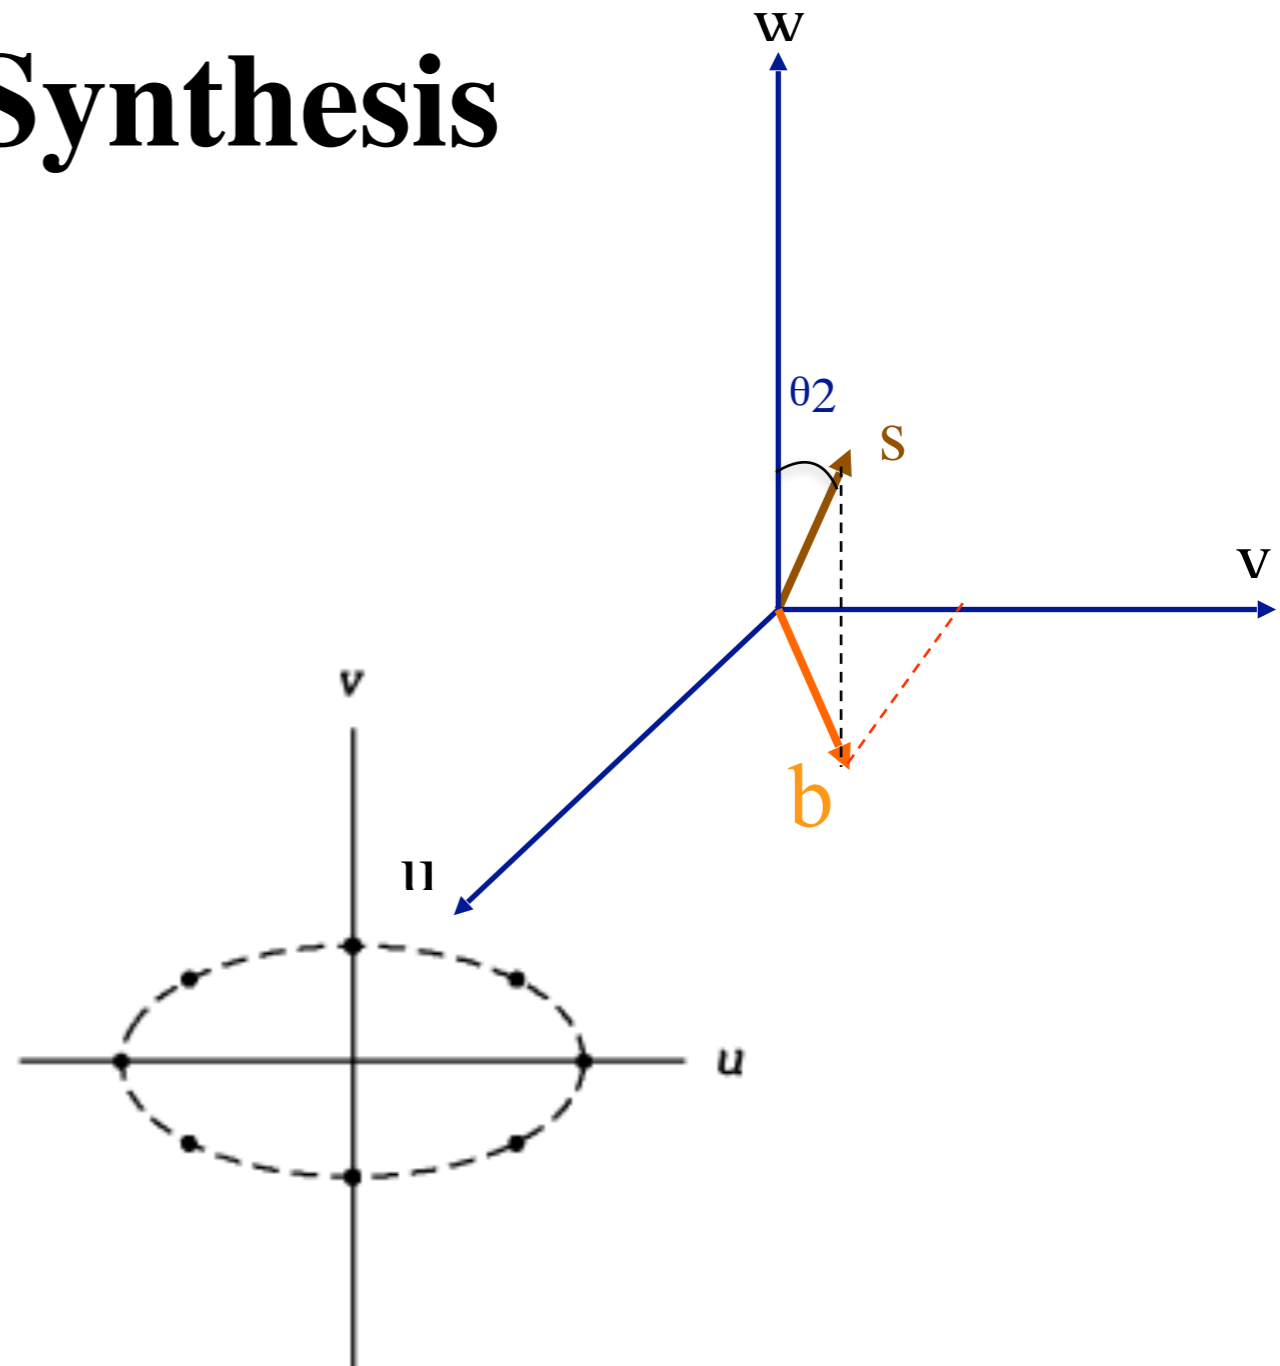

Number of baselines for N antennas:

$$\frac{N(N-1)}{2}$$

- Instantaneous (u,v) coverage near transit
- 10 baselines ranging from 31m to 214m  
⇒ 9.1 to 63 kλ at 88 GHz (3.41mm)
- 10 baselines, 20 (u,v) points, why??:
- Visibility is a Hermitian function:  
 $V(u,v) = V(-u,-v)^*$

# Aperture Synthesis

Two antennas seen from the source

# Earth Rotation Aperture Synthesis!

- $(u,v)$  coverage for full 12 hour observation at declination  $80^\circ$ .

## UV plane sampling

- For small fields of view, the visibility function is the 2-D Fourier transform of the sky brightness:

$$V(u, v) = \iint I(l, m) e^{-2\pi i(ul+vm)} dl dm$$

- We sample the Fourier plane at a discrete number of points:

$$S(u, v) = \sum_k \delta(u - u_k) \cdot \delta(v - v_k)$$

- So the inverse transform is:

$$I^D(x, y) = F^{-1}[S(u, v) \cdot V(u, v)]$$

- Applying the Fourier convolution theorem:

$$I^D(x, y) = B(x, y) \otimes I(x, y)$$

- where  $B$  is the point spread function:

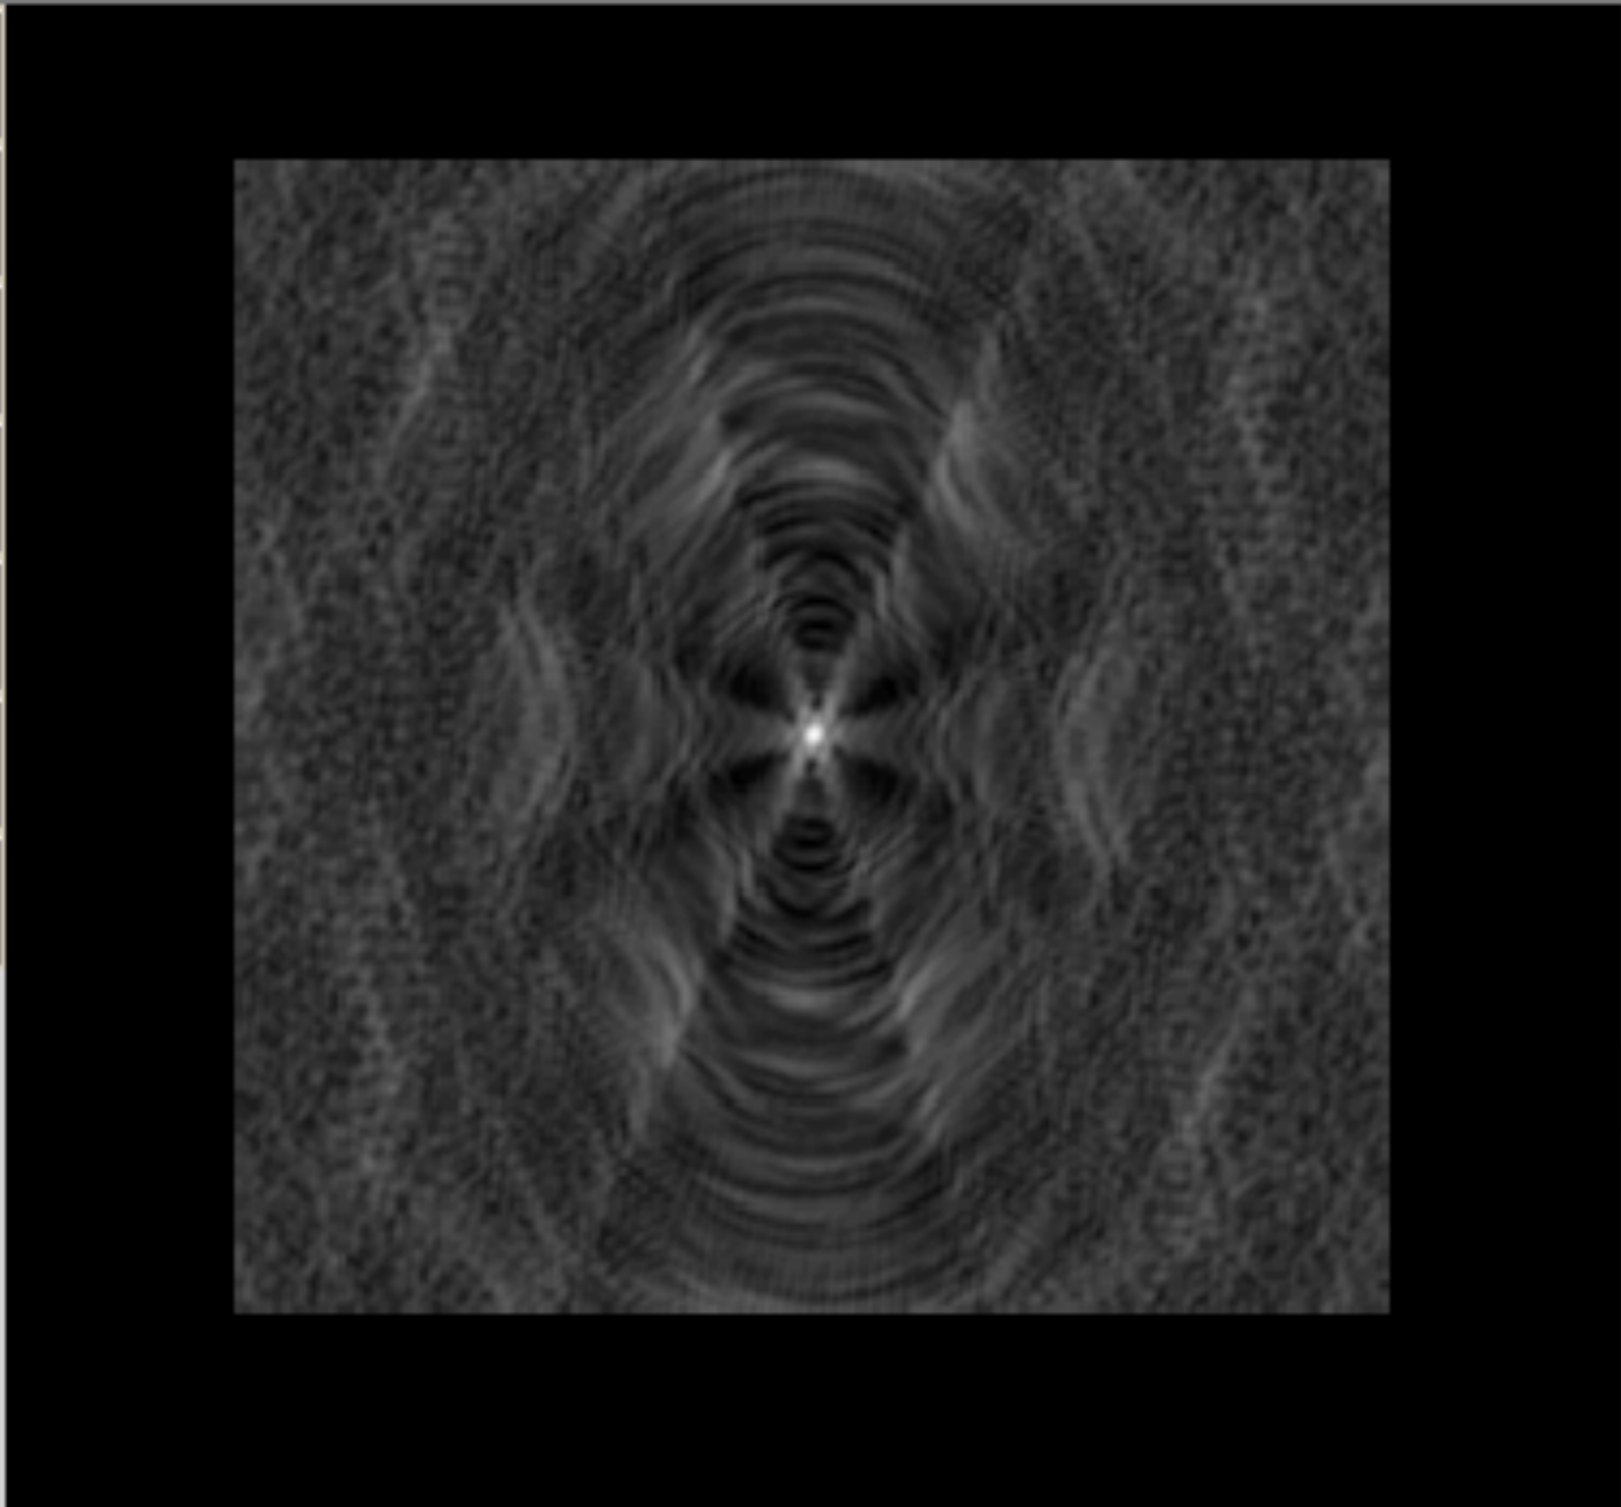

$$B(x, y) = F^{-1}[S(u, v)]$$

## WEBB SPACE TELESCOPE

### Observatory

Webb is NASA's largest and most powerful space science telescope ever constructed. Webb's enormous size and frigid operating temperature present extraordinary engineering challenges. After launching from French Guiana, the observatory will travel to an orbit about one million miles away from Earth and undergo six months of commissioning in space—unfolding its mirrors, sunshield, and other smaller systems; cooling down; aligning; and calibrating. Astronomers worldwide will then be able to conduct scientific observations to broaden our understanding of the universe. Webb will also complement the science achieved by other NASA missions.

### Quick Facts

**PRIMARY MIRROR SIZE:** 21.3 feet (6.5 meters) across

**MIRROR SHAPE:** The mirror is comprised of 18 gold-plated hexagonal deployable segments

**SUNSHIELD:** Webb's five-layer deployable sunshield is the size of a tennis court

**INSTRUMENTS:** Webb has four science instruments: Near-Infrared Camera (NIRCam), Near-Infrared Spectrograph (NIRSpec), Mid-Infrared Instrument (MIRI), and Near-Infrared Imager and Slitless Spectrograph (NIRISS) with the Fine Guidance Sensor (FGS)

**WAVELENGTHS:** Visible, Near Infrared, Mid Infrared (0.6-28.5 micrometers)

Partners

# Single-dish telescopes @ mm & submm

## Nobeyama 45m

- 2 receivers (3, 7 mm)
- BEARS camera of 25 pixels at 3 mm (line/continuum)
- NOBA camera of 7 pixels at 2 mm ( $\Delta\nu=30\text{GHz}$ )

## IRAM 30m

- 4 receivers (1,2,3 mm)
- Camera HERA of 9 pixels at 1mm (line)
- NIKA camera at 2mm and 1mm (continuum)

## LMT 50m

- receivers 3.1 → 1.4 mm
- Camera ToLTEC: 1.1, 1.4, 2.0 mm with 500, 1200, 2000 pixels

## JCMT 15m

- receivers 0.42 → 1.4 mm
- Camera SCUBA2 with 104 pixels at 0.45 & 0.85 mm

## APEX 15m

- 4 receivers 1 & 0.3 mm
- Camera at 0.8mm

# Main single-dish antenna at mm/submm

Telescope	Diameter (m)	Freq. (GHz)	$\lambda$ (mm)	HPBW (")	Latitude (deg)
IRAM	30	70-345	4-0.7	35-7	+37
APEX	12	230-1200	1.3-0.3	30-6	-22
JCMT	15	210-710	2-0.2	20-10	+20
Herschel	3.5	500-2000	0.6-0.1	43-11	space

# Single-dish telescopes at cm

## GBT 100m:

- Antenna off-axis  $100 \times 110\text{m}$
- Receivers:  $0.58 \rightarrow 100\text{ cm}$
- Spectrometer can observe up to 8 different spectral lines
- On-the-Fly-Mapping
- Backend for pulsar observations

# ALMA Overview

- A global partnership to deliver a transformational millimeter/submillimeter interferometer
  - North America (US, Canada, Taiwan)
  - Europe (ESO)
  - East Asia (Japan, Taiwan)
  - In collaboration with Chile
- 5000m (16,500 Ft) site in Chilean Atacama desert
- Main Array: 50 x 12m antennas
  - + Total Power Array 4 x 12m
  - + Atacama Compact Array (ACA): smaller array of 12 x 7m antennas
- Total shared cost ~1.3 Billion (\$US2006)

# ALMA Overview

- Baselines up to 15 km (0.015" at 300 GHz) in "zoom lens" configurations
- Sensitive, precision imaging 84 to 950 GHz (3 mm to 315  $\mu\text{m}$ )
- State-of-the-Art low-noise, wide-band SIS receivers (8 GHz bandwidth)
- Flexible correlator with high spectral resolution at wide bandwidth
- Full polarization capabilities
- Estimate 1 TB/day archived

- A resource for ALL astronomers

ALMA is 10-100 times more sensitive and have 10-100 times better angular resolution compared to previous millimeter interferometers

# ALMA Receiver Bands

Early Science  
Full Operations

# Maximum Angular Scale

Band	Frequency (GHz)	Primary beam (")	Maximum Angular Scale (")	
			Compact	Extended
3	84-116	72 - 52	20	10
6	211-275	29 - 22	9	4.5
7	275-373	22 - 16	6	3
9	602-720	10 - 8.5	3	1.5

- **Smooth** structures larger than MAS are completely resolved out
- Begin to lose total recovered flux for objects on the order of half MAS
  - Need additional observations with a single-dish or a more compact array with smaller antennas

# Technical Information

# The Telescopes

# SKAO

The SKA telescopes are made up of arrays of antennas – SKA-mid observing mid to high frequencies and SKA-low observing low frequencies – to be spread over long distances. The SKA is to be constructed in phases: A first phase in South Africa and Australia, with a later expansion representing a significant increase in capabilities and expanding into other African countries, with the component in Australia also being expanded.

## SKA1-Mid

the SKA's mid-frequency telescope

Location: South Africa

Frequency range:  
**350 MHz**  
to  
**15.4 GHz**  
with a goal of 24 GHz

**197 dishes**  
(including 64 MeerKAT dishes)

Maximum baseline:  
**150km**

## SKA1-Low

the SKA's low-frequency telescope

Location: Australia

Frequency range:  
**50 MHz**  
to  
**350 MHz**

**131,072**  
antennas spread between  
512 stations

Maximum baseline:  
**~74km**
