PETS : building the Lemaitre cosmology sample

DC1 to test the LEMAITRE pipeline

PETS: Motivations

PETS: Preprocessing and sElection of a Training Sample

- **We want a method to select a training sample where all the SN have well defined T_{\max} .**

PETS: Motivations

PETS: Preprocessing and sElection of a Training Sample

- **We want a method to select a training sample where all the SN have well defined T_{\max} .**

How do we define a well defined sampling light curve? Error $T_{\max} < 1\text{day}$? 1-2 pts before and after maximum? Cuts in x_1, c ?

PETS: Motivations

PETS: Preprocessing and sElection of a Training Sample

- **We want a method to select a training sample where all the SN have well defined T_{\max} .**

How do we define a well defined sampling light curve? Error $T_{\max} < 1\text{day}$? 1-2 pts before and after maximum? Cuts in x_1, c ?

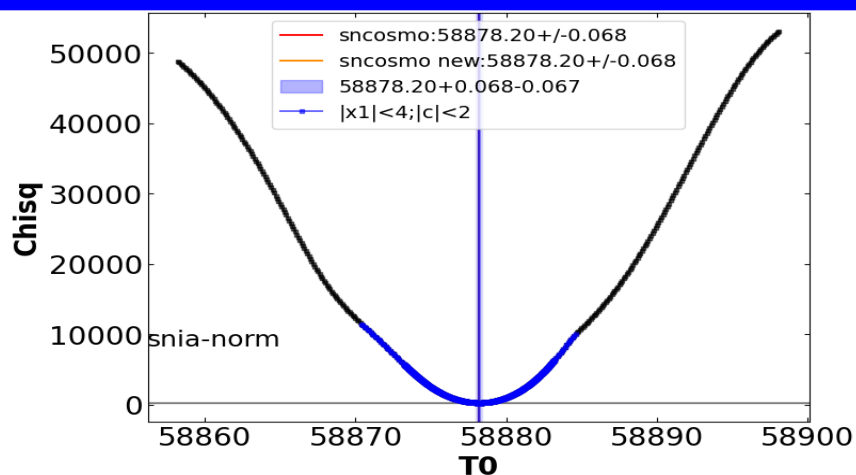

We want a selection based only on the sampling, i.e., observations (like bad weather) not in population (x_1, c , etc)

- **Method: Produce the likelihood profile, i.e., we look at the χ^2 for different T_{\max}**
 - Using `sncosmo` fit all the LC with T_{\max}, x_0, x_1, c as free parameters
 - Fit all the LC with T_{\max} fixed and x_0, x_1, c as free parameters

 $mw_{r_V} = 3.1000000$

- **sncosmo converged**
→ purpose: have data and found a minimum
- **eTmax from chi2<1 day**
→ purpose: T_{max} well defined
- **abs(eTmax-eTmin) at 3sig<0.3**
→ purpose: having minimum symmetric
- **Only 1 min at 3sig**
→ purpose: having only one clear minimum

PETS + NaCl

PETS: Preprocessing and sElection of a Training Sample

- Currently computationally expensive (>7000 SNe, 1300 different Tmax)
- Issues with snocosmo (bounds or not)

→ We use NaCl and reduce the grid (1h in total)
